Task Management Flutter Application

Track Chosen: Track B – Mobile Specialist

This is a Task Management Flutter application developed using Flutter and Dart with local data persistence using SharedPreferences.

Core Features Implemented:
- Create, Read, Update, Delete (CRUD) tasks
- Persistent storage across app restarts
- Modern dark UI with smooth animations
- Responsive and user-friendly interface
- State management using Riverpod

Technical Approach:
The application uses Riverpod for efficient state management and SharedPreferences for lightweight local storage. The UI is designed with a focus on simplicity, usability, and smooth user interactions.

AI Usage:
AI tools (ChatGPT) were used to accelerate development, especially for UI structuring, state management patterns, and debugging setup issues. Some generated code required adjustments for compatibility and performance, which were manually fixed.

Limitations / Future Improvements:
Due to time constraints, some advanced features such as task dependency ("Blocked By"), search & filter, and draft persistence can be further enhanced in future iterations.

Overall, the project demonstrates strong fundamentals in Flutter development, UI design, and application architecture.
